

EX.NO.1 INSTALL VIRTUALBOX WITH LINUX OS ON TOP OF WINDOWS**DATE:****AIM:**

To install Virtualbox with different flavours of linux or windows OS on top of windows host operating system.

Step 1:

Download the following
VMware package
Guest OS (Ubuntu) ISO file

Step 2: Navigate to the directory where the above files are downloaded.

```
user@sys116: ~/Downloads
user@sys116:~$ ls
Android          Downloads        Public
AndroidStudioProjects  examples.desktop Templates
Desktop          Music           Videos
Documents        Pictures        VMware Installation Snapshots
user@sys116:~$ cd Downloads
user@sys116:~/Downloads$ ls
google-chrome-stable_current_amd64.deb
ubuntu-14.04.6-desktop-amd64.iso
VMware-Workstation-Full-16.1.2-17966106.x86_64.bundle
user@sys116:~/Downloads$
```

Step 3:

Change the permissions of the VMware package. Use the following command, `chmod a+x <VMWARE_PACKAGE_NAME>` That is,

`chmod a+x VMware-Workstation-Full-16.1.2-17966106.x86_64.bundle`

Run the next command to install the VMware.

`sudo ./VMware-Workstation-Full-16.1.2-17966106.x86_64.bundle`

```
user@sys116: ~/Downloads
user@sys116:~/Downloads$ chmod a+x VMware-Workstation-Full-16.1.2-17966106.x86_64.bundle
user@sys116:~/Downloads$ sudo ./VMware-Workstation-Full-16.1.2-17966106.x86_64.bundle
```

```
user@sys116: ~/Downloads
user@sys116:~/Downloads$ chmod a+x VMware-Workstation-Full-16.1.2-17966106.x86_64.bundle
user@sys116:~/Downloads$ sudo ./VMware-Workstation-Full-16.1.2-17966106.x86_64.bundle
[sudo] password for user:
Extracting VMware Installer...done.

Installation was successful.
user@sys116:~/Downloads$
```

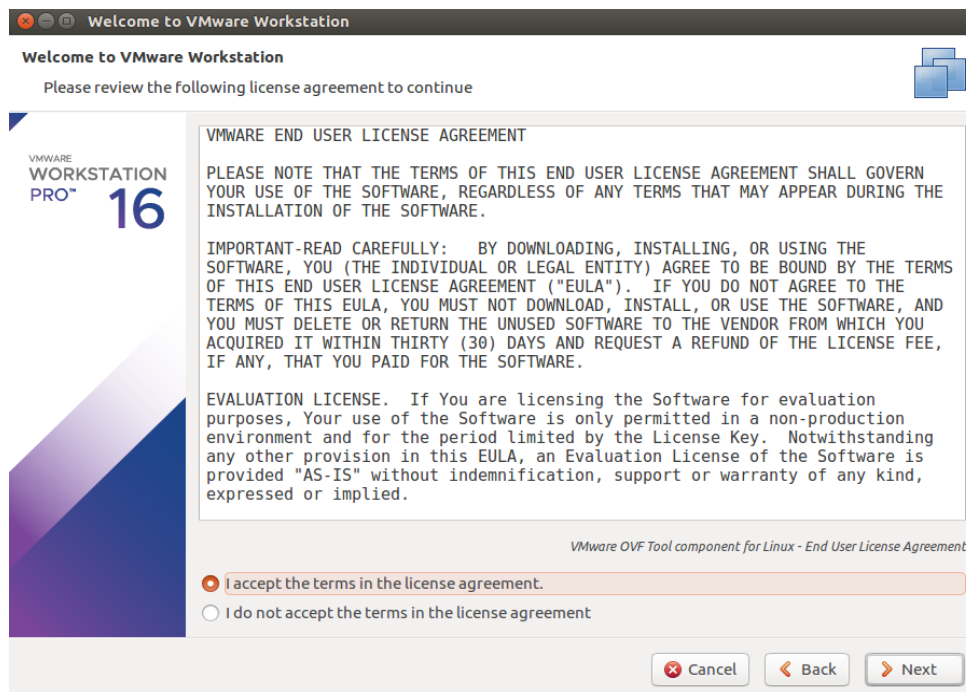

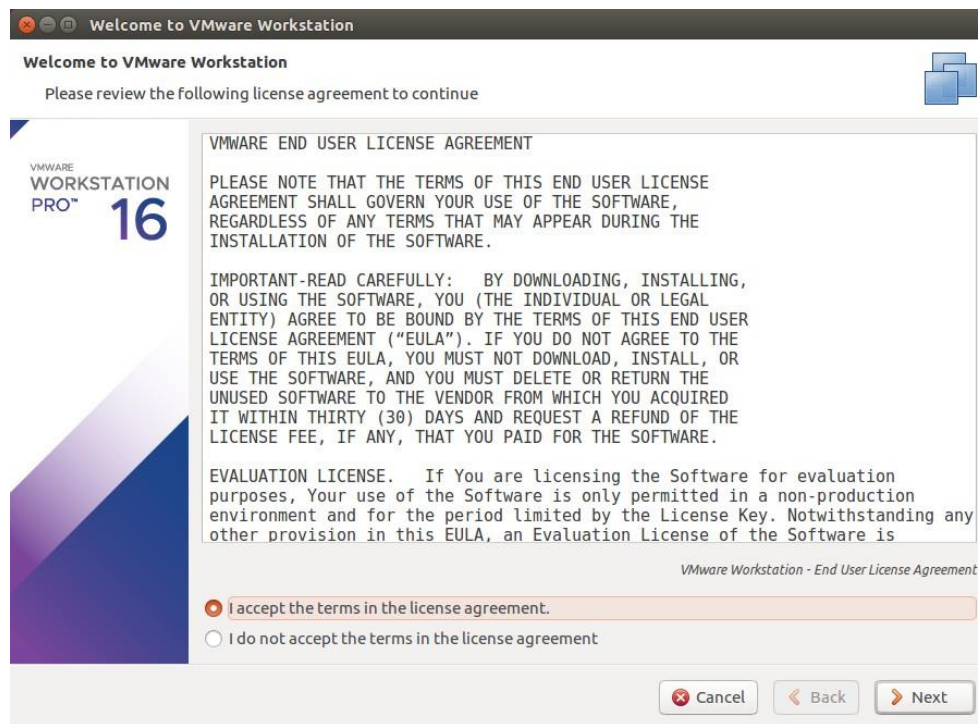

Step 4:

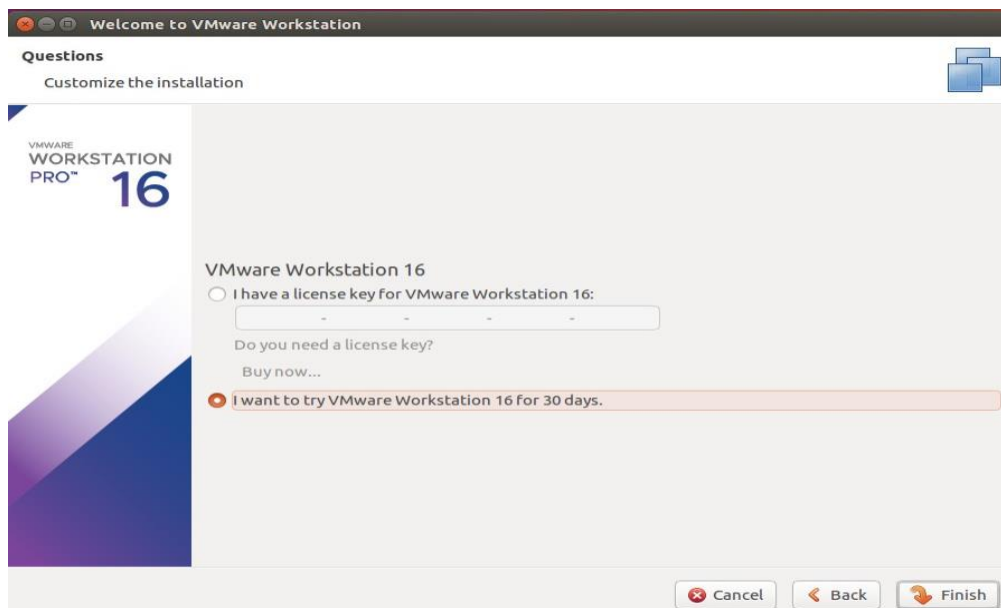

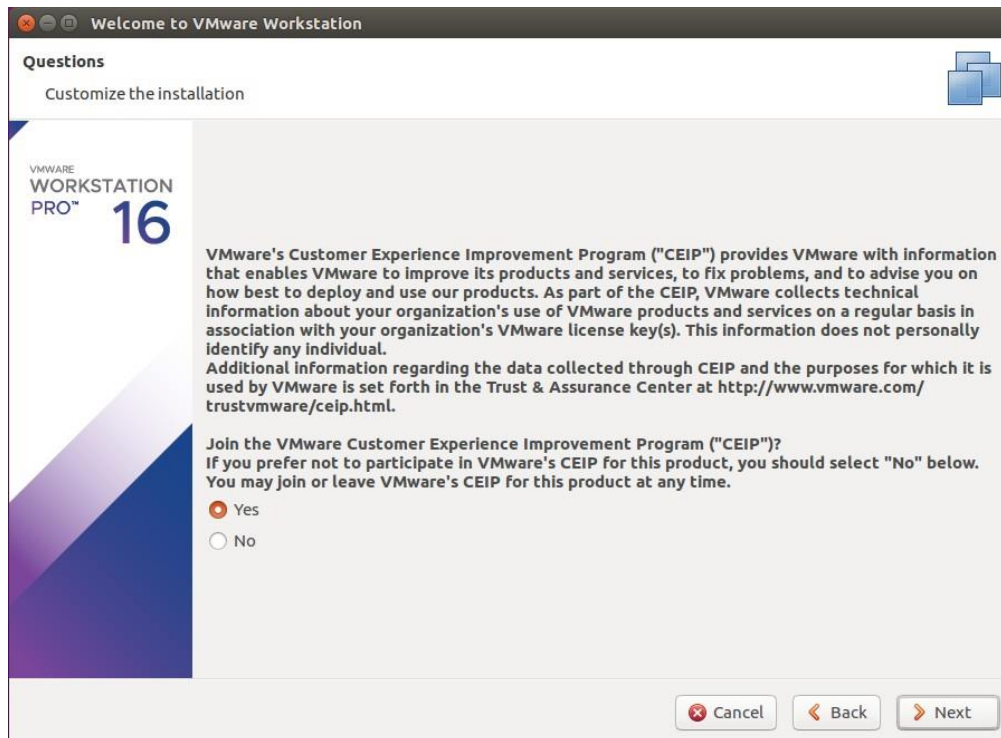

Open VMware Player

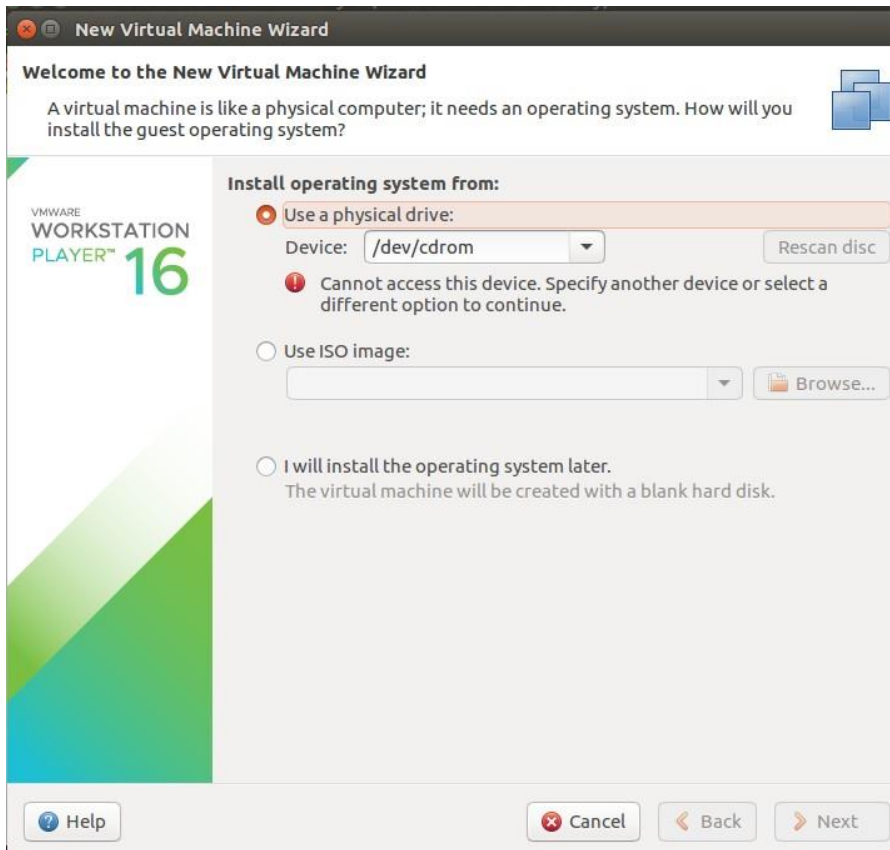

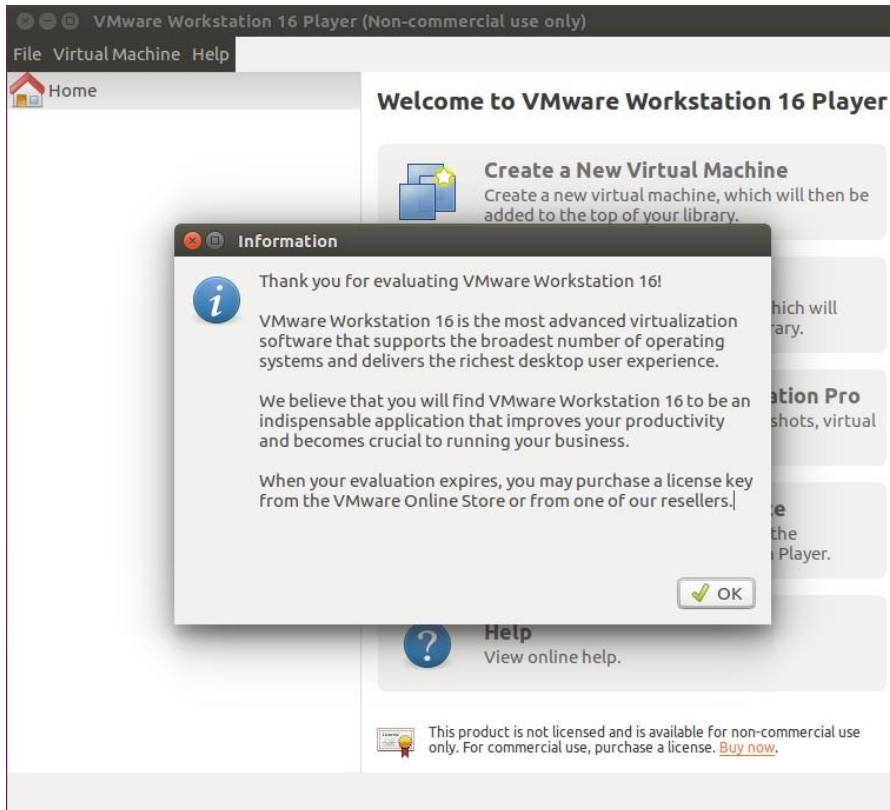

Accept all the agreements, terms and conditions.

Select all the default settings and continue.

VMware is successfully installed on your Host Machine.

Step 5:

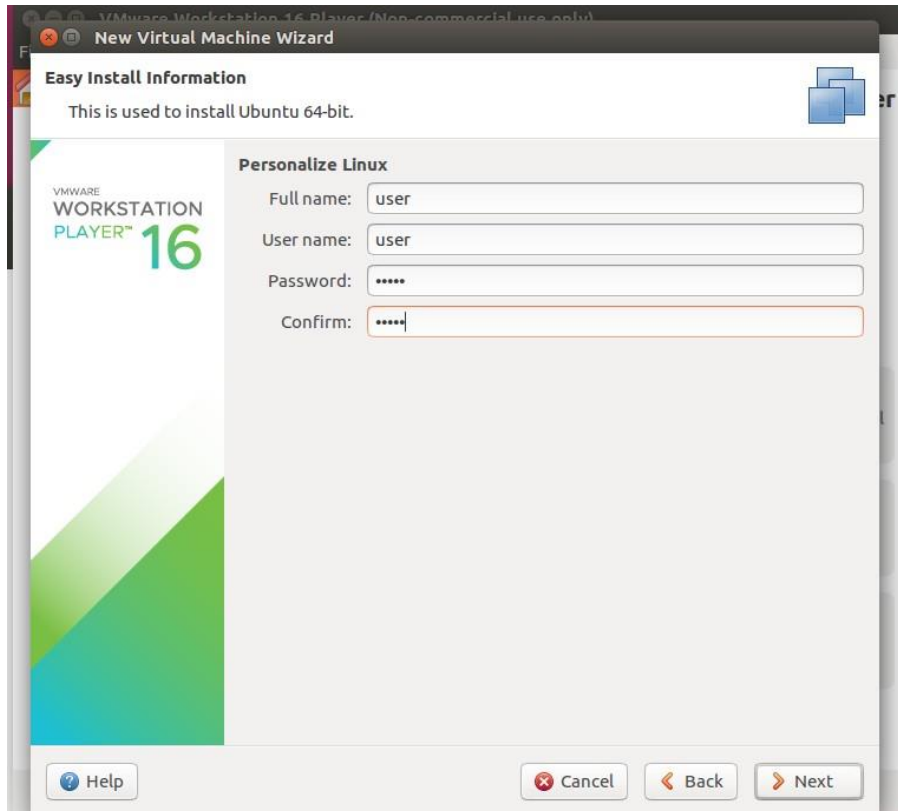

Select "Create a new Virtual Machine"

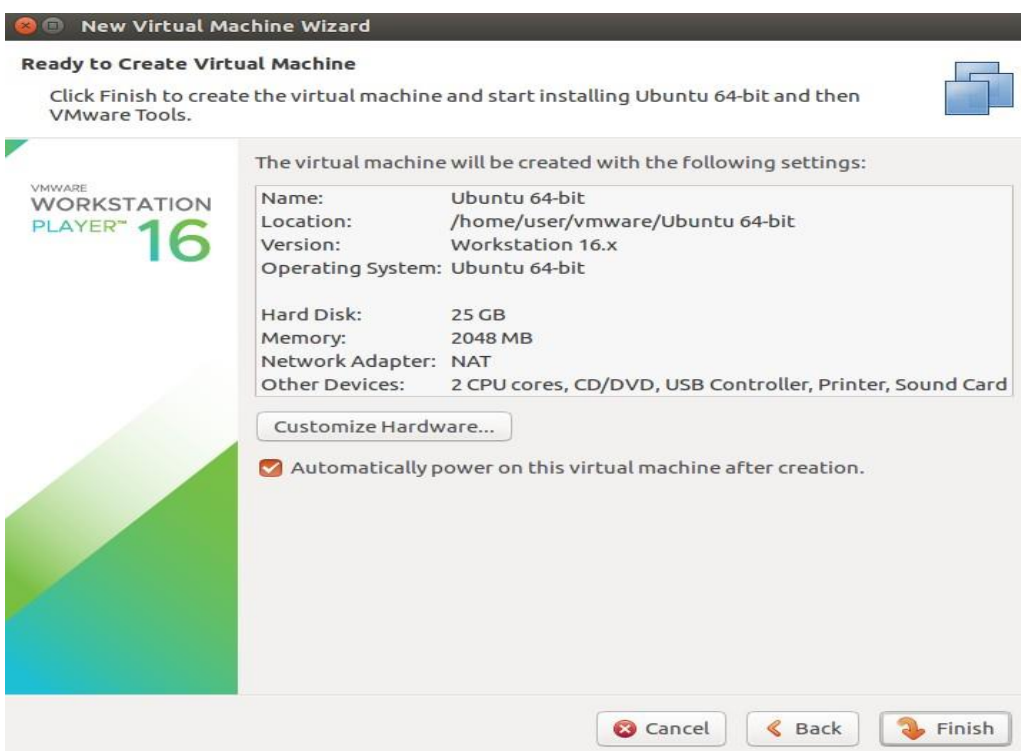

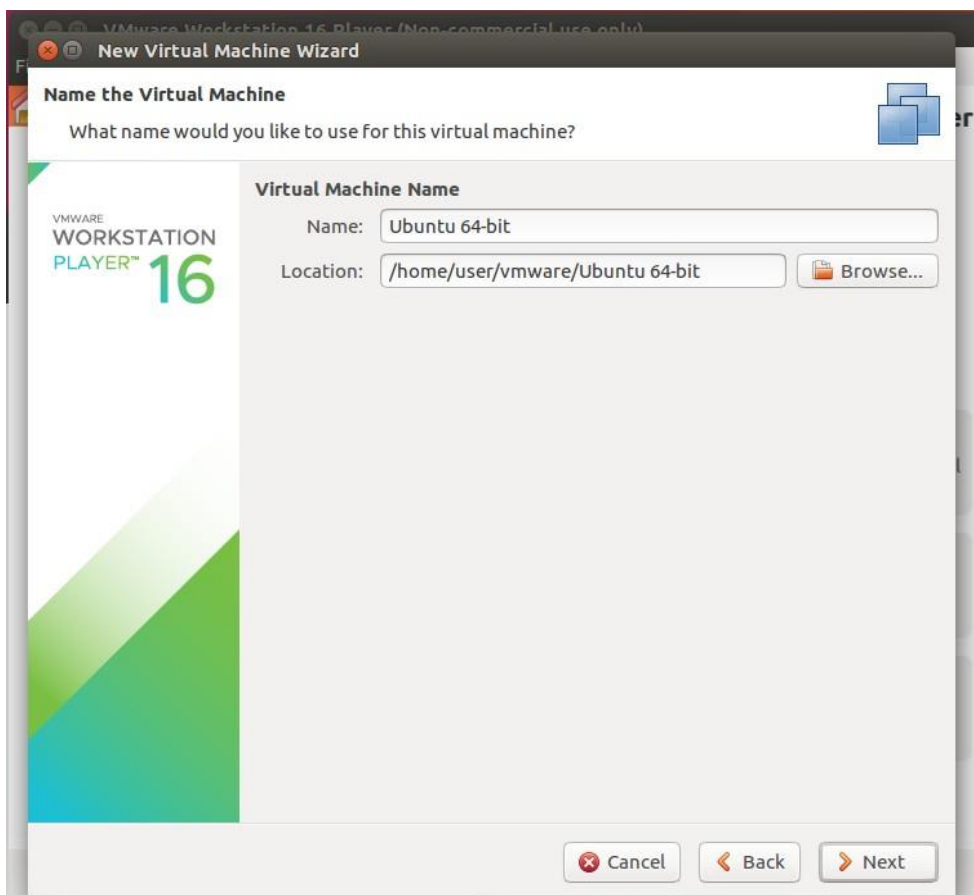

Select "Use ISO image" and Browse your Guest OS ISO image path and click "Next".

Use your password as "admin" and click "Next".

Click "Next"

Select your disk size upto a maximum of 25GB and Click "Next".

Select Finish

Guest OS is installed Successfully.

RESULT:

Thus installation of Virtualbox with different flavours of linux or windows OS on top of windows host operating system is completed successfully.

Install Gcc Compilers in Virtual Machine

Date :

Aim: To install a C compiler in the virtual machine and execute a sample program.

Algorithm:

Step 1: To check Gcc compiler is installed or not.

```
$ dpkg -l | grep gcc
```

Step 2: If GCC compiler is not installed in VM, to execute the following command

```
$sudo apt-get install gcc (or) $sudo apt-get install build-essential
```

Step 3: Open a Vi Editor

Step 4: Get the no. of rows and columns for first and second

matrix. Step 5: Get the values of x and y matrix using for loop.

Step 6: Find the product of first and second and store the result in multiply matrix. $\text{multiply}[i][j] = \text{multiply}[i][j] + (\text{first}[i][k] * \text{second}[k][j]);$

Step 7: Display the resultant

matrix. Step 8: Stop the program.

Program:

```
#include <stdio.h>
```

```
void main()
```

$$\{$$

```
int m, n, p, q, c, d, k, sum = 0;
```

```
int first[10][10], second[10][10], multiply[10][10];
```

```
printf("Enter the number of rows and columns of first matrix\n");
```

```
scanf("%d%d", &m, &n);
```

```
printf("Enter the elements of first matrix\n");
```

```
for ( c = 0 ; c < m ; c++ )
```

```
for ( d = 0 ; d < n ; d++ )
```

```
scanf("%d", &first[c][d]);
```

```
printf("Enter the number of rows and columns of second matrix\n");
```

```
scanf("%d%d", &p, &q);
```

```

if ( n != p )

```

```
printf("Matrices with entered orders can't be multiplied with each other.\n");
```

else

 $\{$

```
printf("Enter the elements of second matrix\n");
```

```
for ( c = 0 ; c < p ; c++ ) for ( d
```

```

= 0 ; d < q ; d++ ) scanf("%d",

```

```
&second[c][d]); for ( c = 0 ; c
```

```
< m ; c++ )
```

 $\{$

```
for ( d = 0 ; d < q ; d++ )
```

 $\{$

```
for ( k = 0 ; k < p ; k++ )
```

 $\{$

```
sum = sum + first[c][k]*second[k][d];
```

```
    }

    multiply[c][d] = sum;
    sum = 0;
  }
}
printf("Product of entered matrices:-\n");
for ( c = 0 ; c < m ; c++ )
{

}
}
}
```

Output:

Compile: cse105@it105-HP-ProDesk-400-G1-SFF:~\$ gcc matrix.c

Run: cse105@cse105-HP-ProDesk-400-G1-SFF:~\$./a.out

Enter the number of rows and columns of first matrix

2 2

Enter the elements of first matrix

2 2 2 2

Enter the number of rows and columns of second matrix

2 2

Enter the elements of second matrix

2 2 2 2

Product of entered matrices:-

8 8

8 8

Result :

Thus a C compiler in the virtual machine to execute a sample program has been executed successfully.

EXNO: 3 **INSTALLING GOOGLE APP ENGINE****AIM:**

To Install Google App Engine. Create hello world app and other simple web applications using python/java.

STEP 1

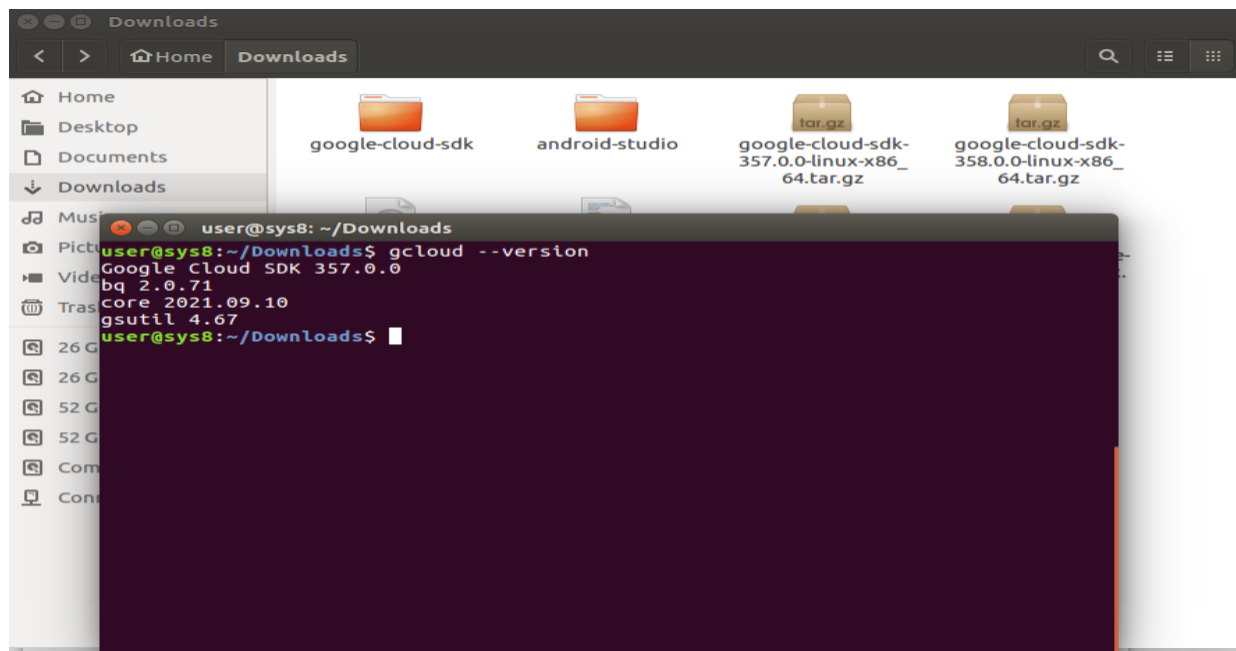

- Download google cloud SDK from the google cloud website
[<https://cloud.google.com/sdk/docs/install>]
(OR)
- Click the following link to download the required Google Cloud SDK
[https://dl.google.com/dl/cloudsdk/channels/rapid/downloads/google-cloud-sdk-357.0.0-linux-x86_64.tar.gz]
Extract the zip folder in Downloads/ folder

STEP 2

- Open new terminal in Downloads/ folder and install the google cloud
`./google-cloud-sdk/install.sh`

- Open a new terminal and initialized the gcloud
`./google-cloud-sdk/bin/gcloud init`

- Login to your google account and continue the process by accepting the terms and conditions
- Now run `dev_appserver.py` command in your terminal.

```
user@sys8: ~/Downloads
* Run `gcloud topic --help` to learn about advanced features of the SDK like arg
files and output formatting
user@sys8:~/Downloads$ dev_appserver.py
This action requires the installation of components: [app-engine-
python, cloud-datastore-emulator]

Your current Cloud SDK version is: 357.0.0
Installing components from version: 357.0.0

These components will be installed.
```

Name	Version	Size
Cloud Datastore Emulator	2.1.0	18.4 MiB
gRPC Python library	1.20.0	2.1 MiB
gcloud app Python Extensions	1.9.93	7.7 MiB

```
For the latest full release notes, please visit:
https://cloud.google.com/sdk/release_notes

Do you want to continue (Y/n)?
```

- Create a `main.py` file and `app.yaml` file in your desired folder
- Inside `main.py` write a simple hello world program

```
app.yaml (~/.GAE/Ex1) - gedit
Open Save

runtime: python27
api_version: 1
threadsafe: false

handlers:
- url: /*.*
  script: main.py
  secure: always
  login: admin
```

YAML Tab Width: 8 Ln 10, Col 1 INS

- Finally run the app using

```
user@sys8: ~/GAE/Ex1
user@sys8:~/Downloads$ cd ..
user@sys8:~$ ls
Android          Desktop          GAE-Projects    snap
AndroidStudioProjects  Documents       Music           Templates
curl-7.50.3      Downloads       Pictures        Videos
curl-7.50.3.tar.gz  examples.desktop  Public         vmware
user@sys8:~$ mkdir -p GAE/Ex1/
user@sys8:~$ cd GAE/Ex1/
user@sys8:~/GAE/Ex1$ touch main.py app.yaml
user@sys8:~/GAE/Ex1$ gedit main.py
user@sys8:~/GAE/Ex1$ gedit app.yaml
user@sys8:~/GAE/Ex1$ dev_appserver.py "app.yaml"
INFO      2021-09-30 08:07:26,554 devappserver2.py:309] Skipping SDK update check
.
WARNING   2021-09-30 08:07:26,964 simple_search_stub.py:1196] Could not read search indexes from /tmp/appengine.None.user/search_indexes

```

```
$ dev_appserver.py "app.yaml"
```

- Go to <http://localhost:8000/>

Result :

Thus installation of Google App Engine is completed and hello world app using python is completed successfully

EXNO: 4

GAE LAUNCHER TO LAUNCH THE WEB APPLICATIONS.

AIM:

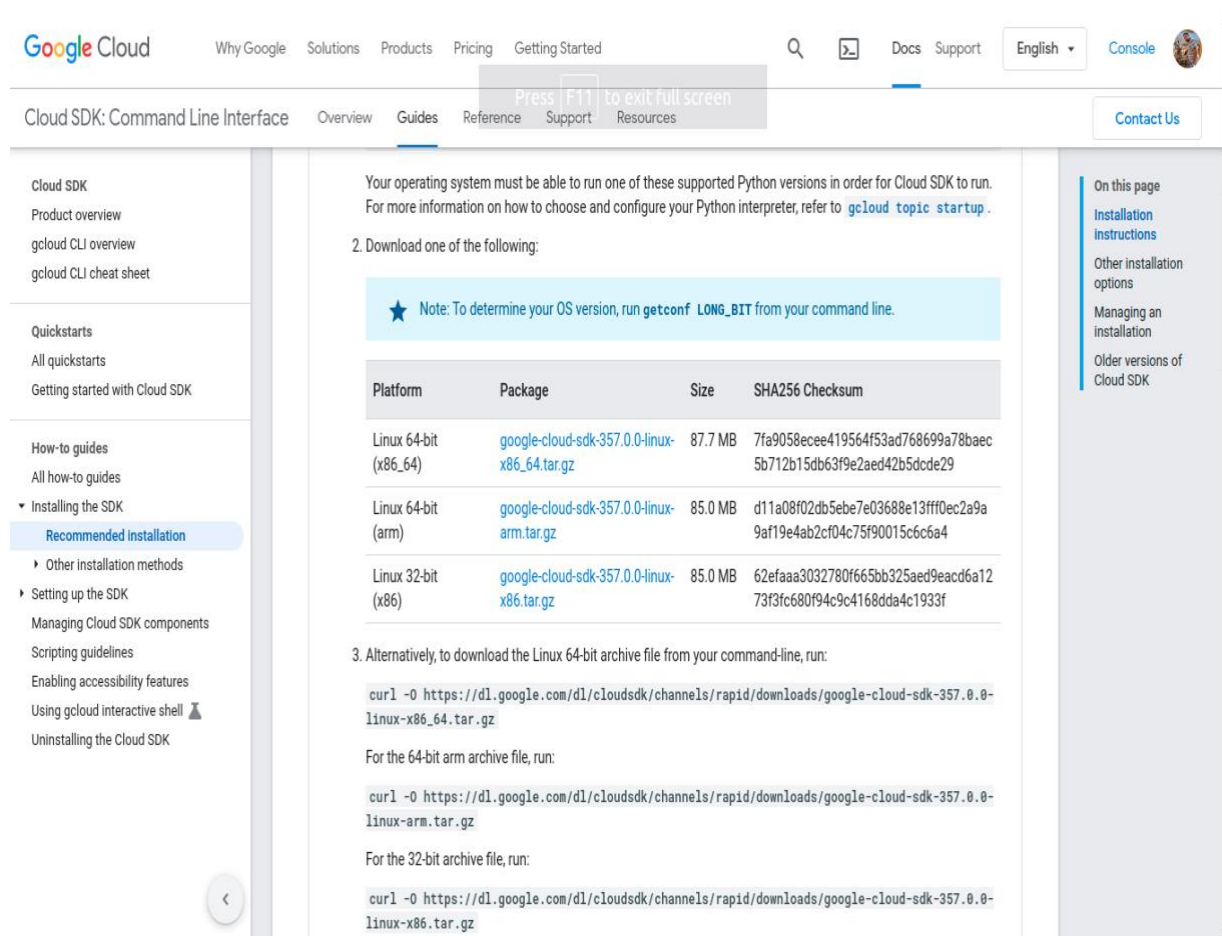

To use GAE launcher to launch the web applications.

PROCEDURE :

Step 1 – Go to Cloud SDK

<https://cloud.google.com/sdk/docs/install>

Step 2 – Download Linux 64-bit (x86_64)

Google Cloud

All quickstarts

Getting started with Cloud SDK

How-to guides

All how-to guides

Installing the SDK

Recommended installation

Other installation methods

Setting up the SDK

Managing Cloud SDK components

Scripting guidelines

Enabling accessibility features

Using gcloud interactive shell

Uninstalling the Cloud SDK

Your operating system must be able to run one of these supported Python versions in order for Cloud SDK to run. For more information on how to choose and configure your Python interpreter, refer to [gcloud topic startup](#).

2. Download one of the following:

Note: To determine your OS version, run `getconf LONG_BIT` from your command line.

Platform	Package	Size	SHA256 Checksum
Linux 64-bit (x86_64)	google-cloud-sdk-357.0.0-linux-x86_64.tar.gz	87.7 MB	7fa9058ecee419564f53ad768699a78baec5b712b15db63f9e2aed42b5dcode29
Linux 64-bit (arm)	google-cloud-sdk-357.0.0-linux-arm.tar.gz	85.0 MB	d11a08f02db5ebe7e03688e13fff0ec2a9a9af19e4ab2cf04c75f90015c6c6a4
Linux 32-bit (x86)	google-cloud-sdk-357.0.0-linux-x86.tar.gz	85.0 MB	62efaaa3032780f665bb325aed9eacd6a1273f3fc680f94c9c4168dda4c1933f

3. Alternatively, to download the Linux 64-bit archive file from your command-line, run:

```
curl -O https://dl.google.com/dl/cloudsdk/channels/rapid/downloads/google-cloud-sdk-357.0.0-linux-x86_64.tar.gz
```

For the 64-bit arm archive file, run:

```
curl -O https://dl.google.com/dl/cloudsdk/channels/rapid/downloads/google-cloud-sdk-357.0.0-linux-arm.tar.gz
```

For the 32-bit archive file, run:

```
curl -O https://dl.google.com/dl/cloudsdk/channels/rapid/downloads/google-cloud-sdk-357.0.0-linux-x86.tar.gz
```

On this page

Installation instructions

Other installation options

Managing an installation

Older versions of Cloud SDK

Step 3 – Extract the Zip File from downloads

Step 4 – Open Terminal in Downloads

Step 5 – Run the following command

./google-cloud-sdk/install.sh

Step 6 – Init the cloud sdk using the following command

`./google-cloud-sdk/bin/gcloud init`

Step 7 – Run “**dev_appserver.py**” in the terminal

Step 8 – Create Project Folder, Download the zip file from the below link and unzip it.

<https://drive.google.com/file/d/18gHSvne6r11yT70X6x7HtmJlpLTBieYq/view?usp=sharing>

Step 9 - Create a App.yaml file

App.yaml

runtime: python27

api_version: 1

threadsafe: true

handlers:

- url: /

static_files: project/index.html

upload: project/index.html

- url: /

static_dir: project

Step 10 - Go to the Project Folder and open the terminal

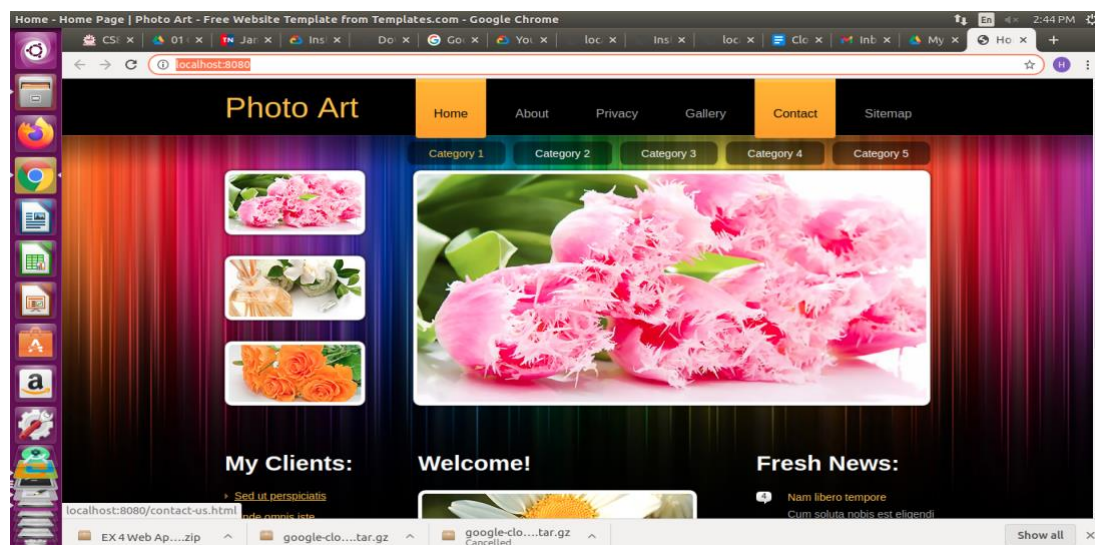

dev_appserver.py “app.yaml”

Step 11 - Go to <http://localhost:8000>

“If Localhost not opening then run this command”

fuser -n tcp -k 8080

OUTPUT :

RESULT :

Thus the GAE launcher has been successfully used to launch the web applications.

EXNO: 5**Study on CloudSim is a simulation toolkit****Aim:**

To study about the tools and features of Cloud sim

Description:

CloudSim is a simulation toolkit that supports the modeling and simulation of the core functionality of cloud, like job/task queue, processing of events, creation of cloud entities(datacenter, datacenter brokers, etc), communication between different entities, implementation of broker policies, etc.

This toolkit allows to:

- Test application services in a repeatable and controllable environment.
- Tune the system bottlenecks before deploying apps in an actual cloud.
- Experiment with different workload mix and resource performance scenarios on simulated infrastructure for developing and testing adaptive application provisioning techniques

Core features of CloudSim are:

- The Support of modeling and simulation of large scale computing environment as federated cloud data centers, virtualized server hosts, with customizable policies for provisioning host resources to virtual machines and energy-aware computational resources
- It is a self-contained platform for modeling cloud's service brokers, provisioning, and allocation policies.
- It supports the simulation of network connections among simulated system element

Support for simulation of federated cloud environment, that inter-networks resources from both private and public domains.

- Availability of a virtualization engine that aids in the creation and management of multiple independent and co-hosted virtual services on a data center node.
- Flexibility to switch between space shared and time shared allocation of processing cores to virtualized services.

The cloudsims allows to model and simulate the cloud system components, therefore to support its function different set of classes has been developed by its developers like:

- To simulating the regions and datacenters the class named "Datacenter.java" is available in org.cloudbus.cloudsim package.
- To simulate the workloads for cloud, the class named as "Cloudlet.java" is available in org.cloudbus.cloudsim package.
- To simulate the load balancing and policy-related implementation the classes named "DatacenterBroker.java", "CloudletScheduler.java", "VmAllocationPolicy.java", etc are available under org.cloudbus.cloudsim package.
- Now because all the different simulated hardware models are required to communicate with each other to share the simulation work updates for this cloudsims has implemented a discrete event simulation engine that keeps track of all the task assignments among the different simulated cloud components.

Cloudsim is used for

- Load Balancing of resources and tasks
- Task scheduling and its migrations
- Optimizing the Virtual machine allocation and placement policies
- Energy-aware Consolidations or Migrations of virtual machines
- Optimizing schemes for Network latencies for various cloud scenarios

Cloudsim simulation toolkit setup is easy. Before you start to setup CloudSim, following resources must be Installed/downloaded on the local system

- **Java Development Kit(JDK)**
- **Eclipse IDE for Java developers**
- **Download CloudSim source code**
- **Download Common Math libraries**

Result:

Thus the study on cloudsim simulation tool is done successfully.

EXNO: 5 a SIMULATE A CLOUD SCENARIO USING CLOUDSIM**Aim:**

To simulate a cloud scenario using CloudSim and run a scheduling algorithm.

Description:

Cloudsim is a simulation toolkit that supports the modeling and simulation of the core functionality of the cloud. This article discusses the overview of the cloudsim toolkit and helps you get started along with reference to the relevant resources.

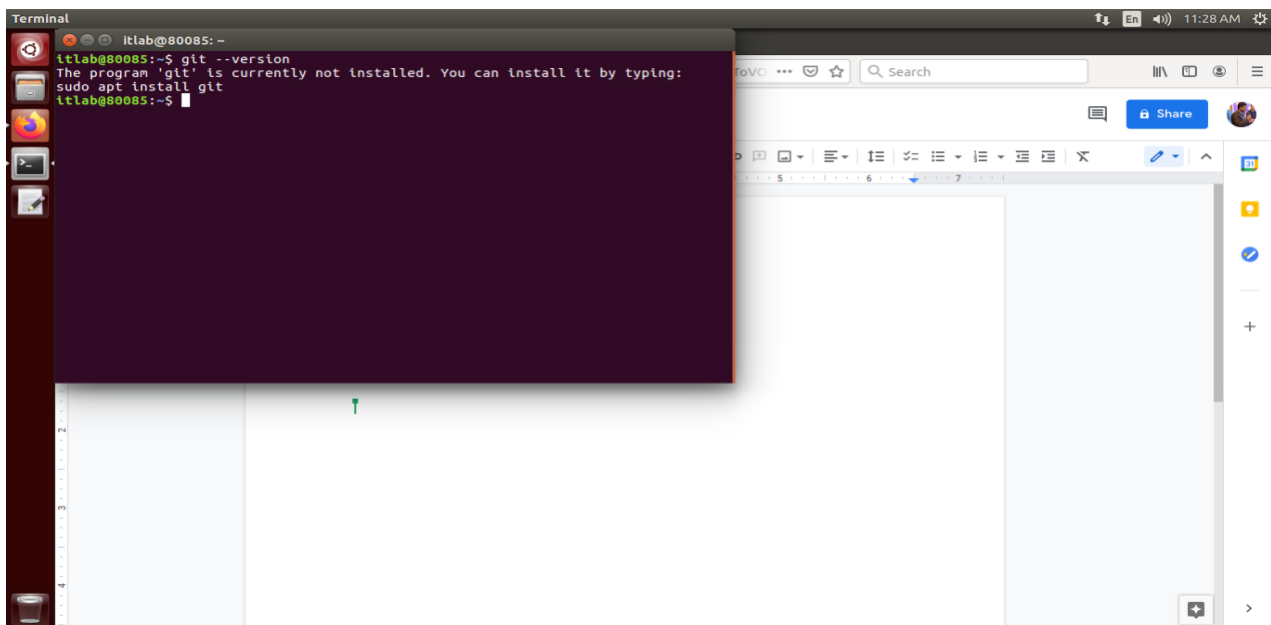

Procedure:

1. Check for git installation

git --version

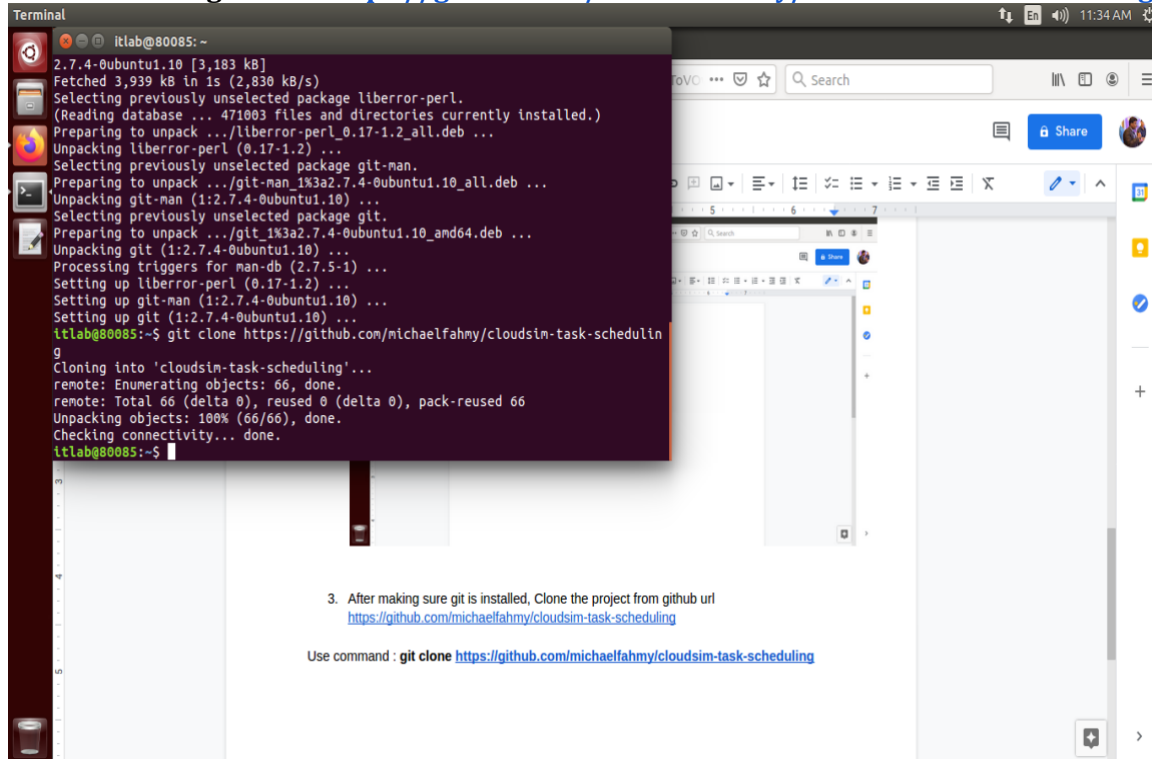

2. If git is not installed,
Use **sudo apt-get install git**

3. After making sure git is installed, Clone the project from github url

<https://github.com/michaelfahmy/cloudsim-task-scheduling>

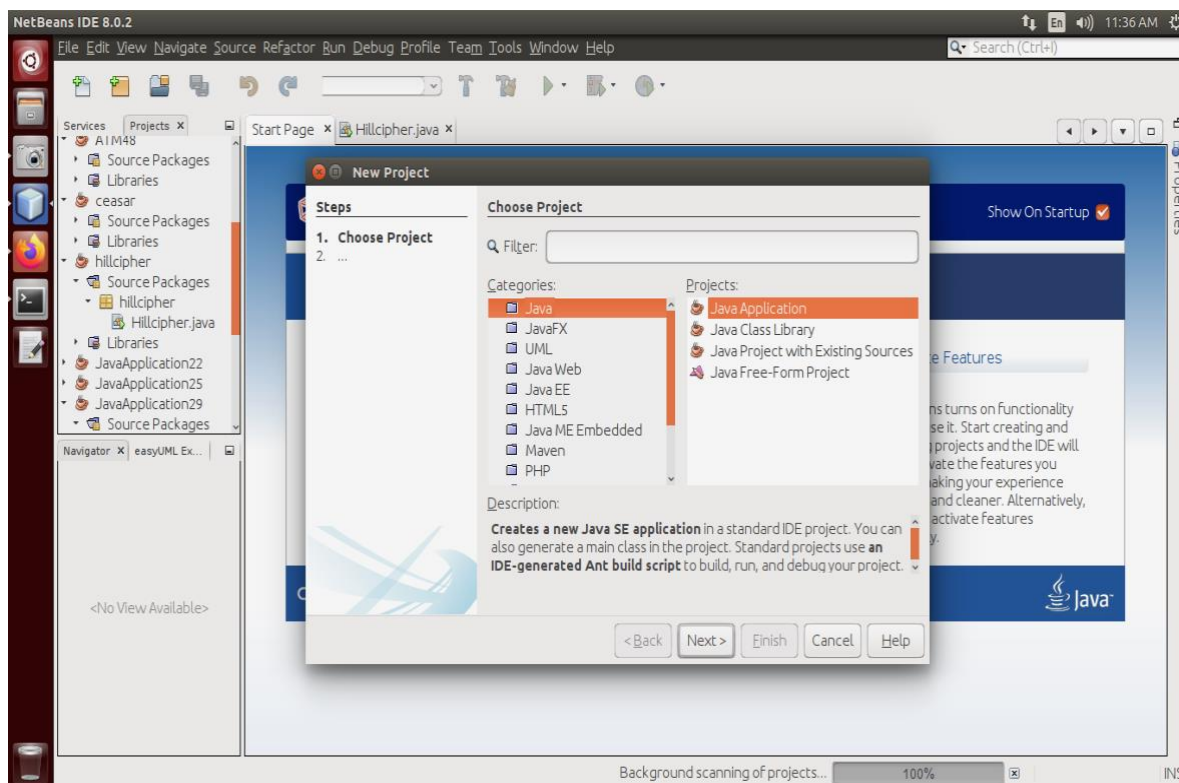

Use command : **git clone** <https://github.com/michaelfahmy/cloudsim-task-scheduling>

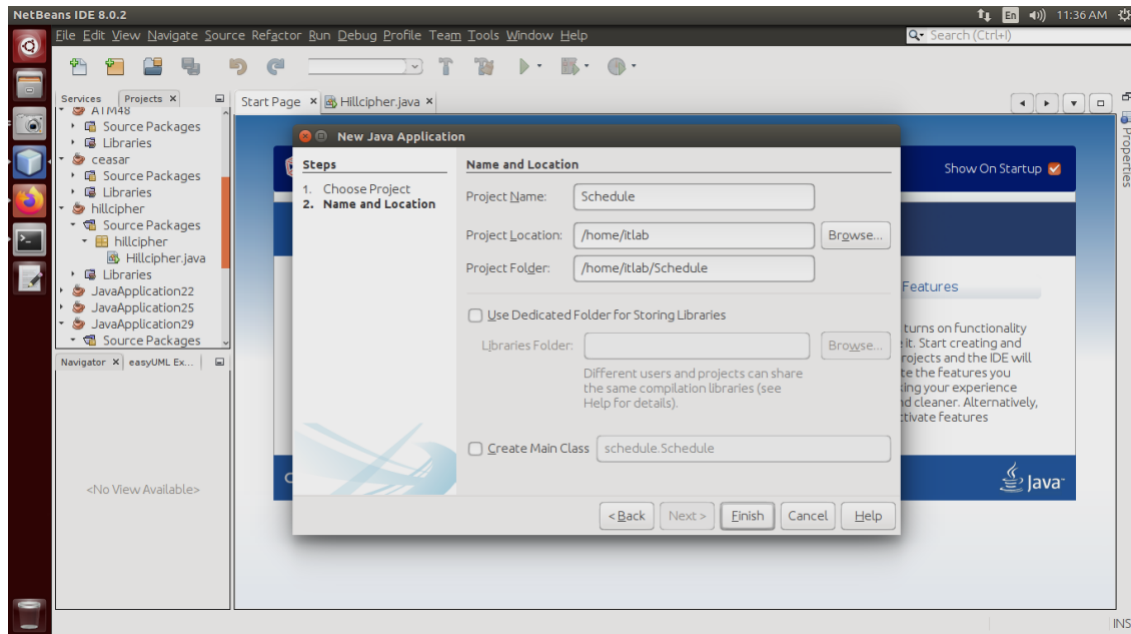

3. After making sure git is installed, Clone the project from github url
<https://github.com/michaelfahmy/cloudsim-task-scheduling>

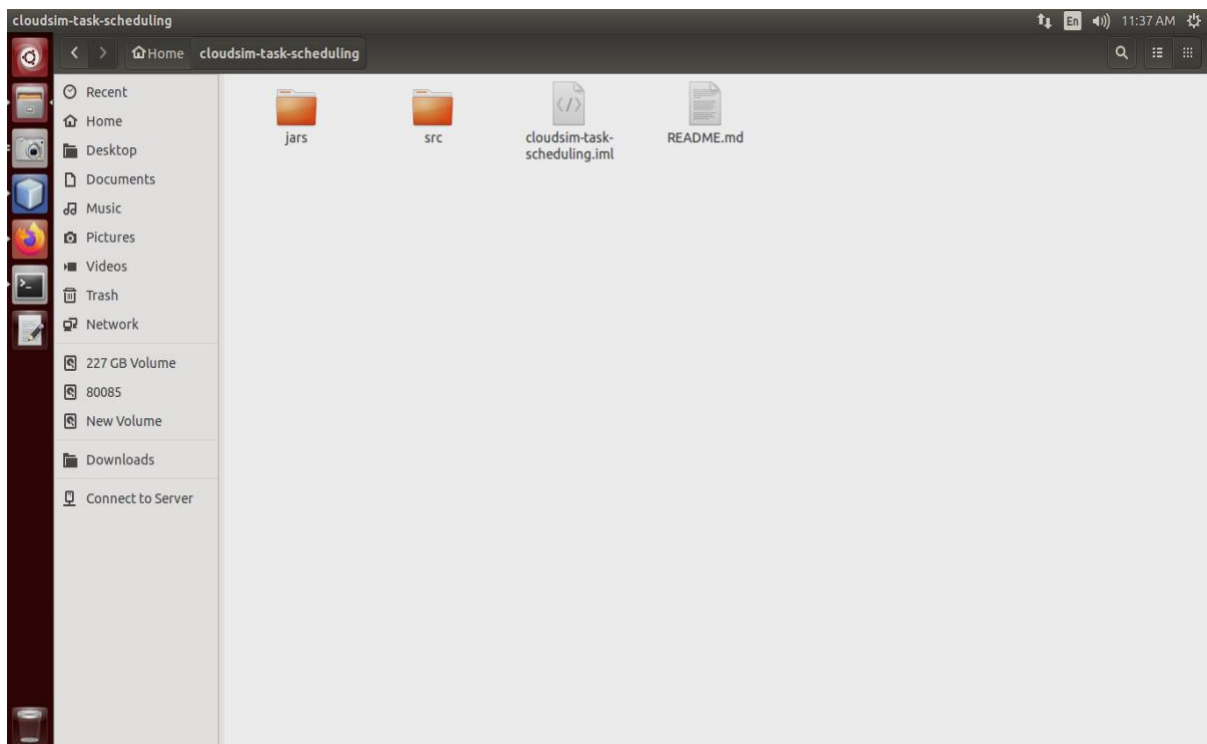

Use command : **git clone** <https://github.com/michaelfahmy/cloudsim-task-scheduling>

4. Open netbeans 8.x and create a new java project from files

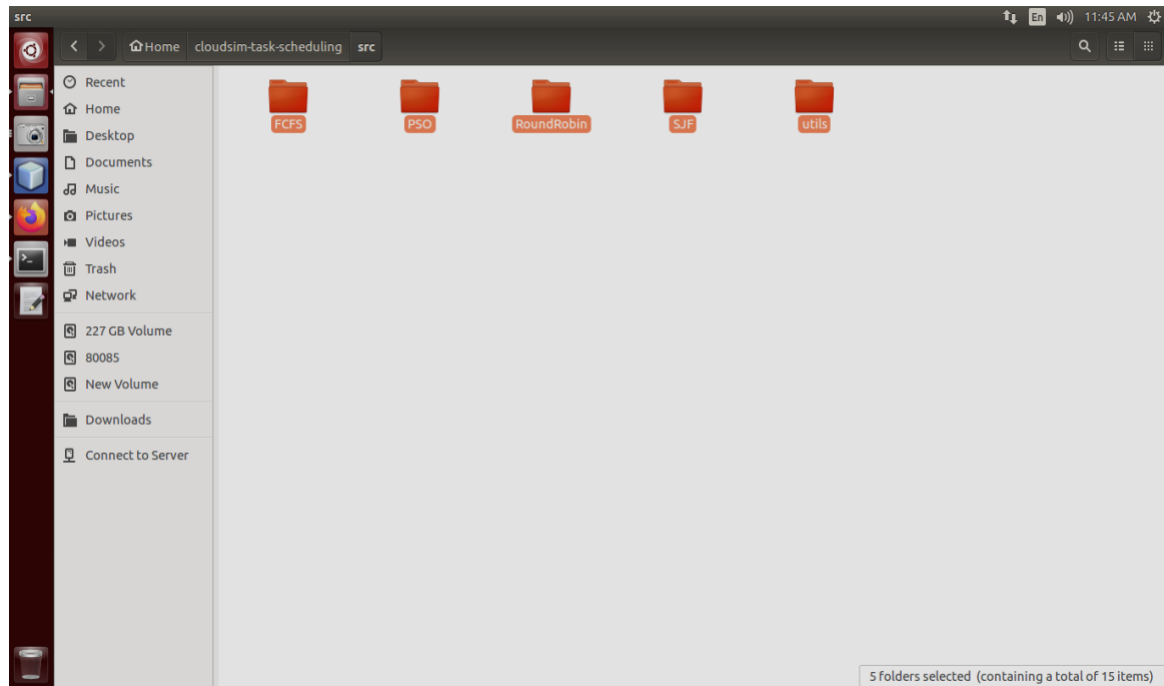

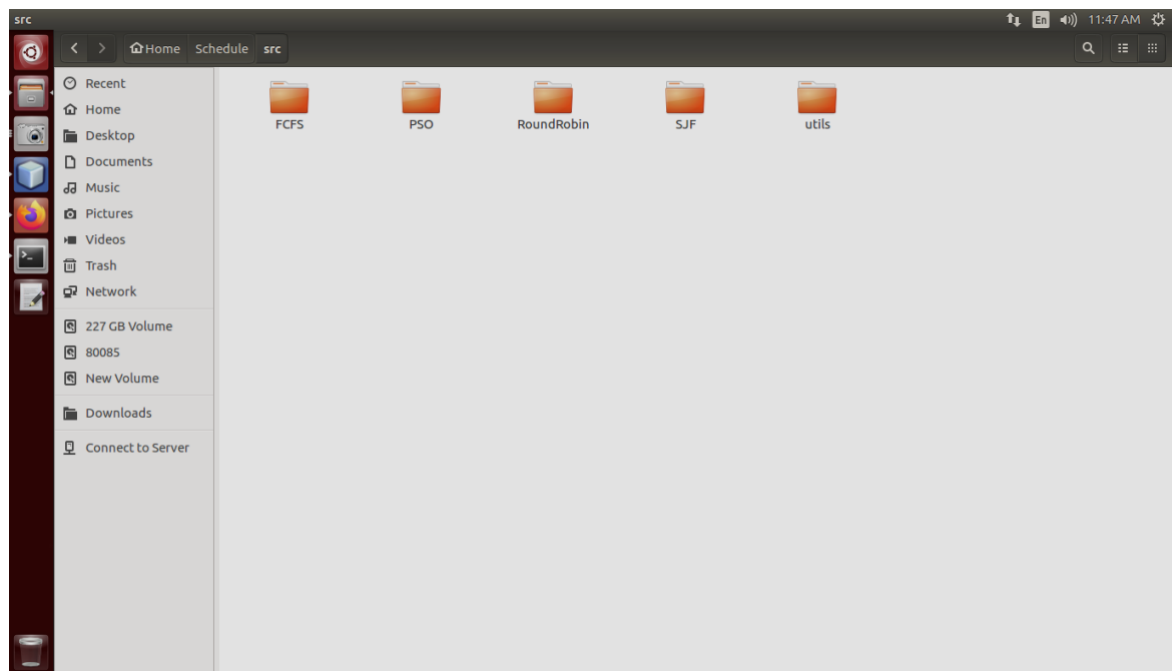

5. Now find the cloned project folder which generally in linux will be in /home/itlab

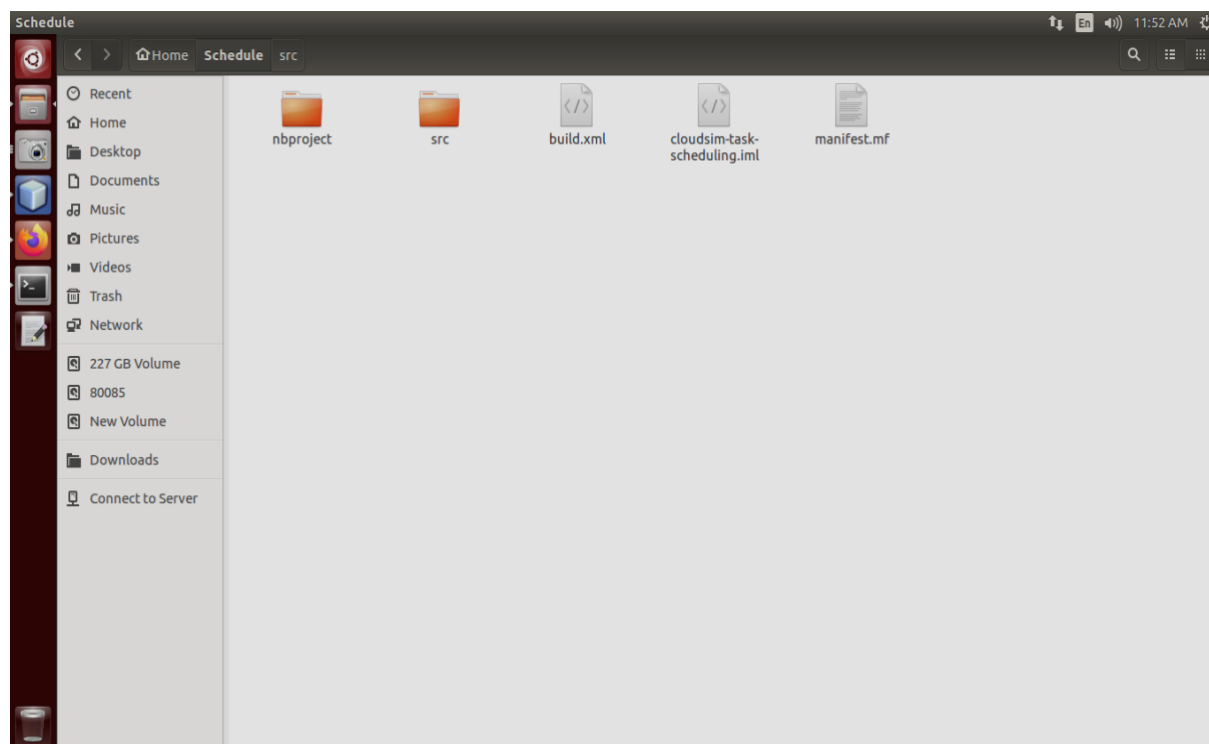

6. Open the src folder and copy the folders

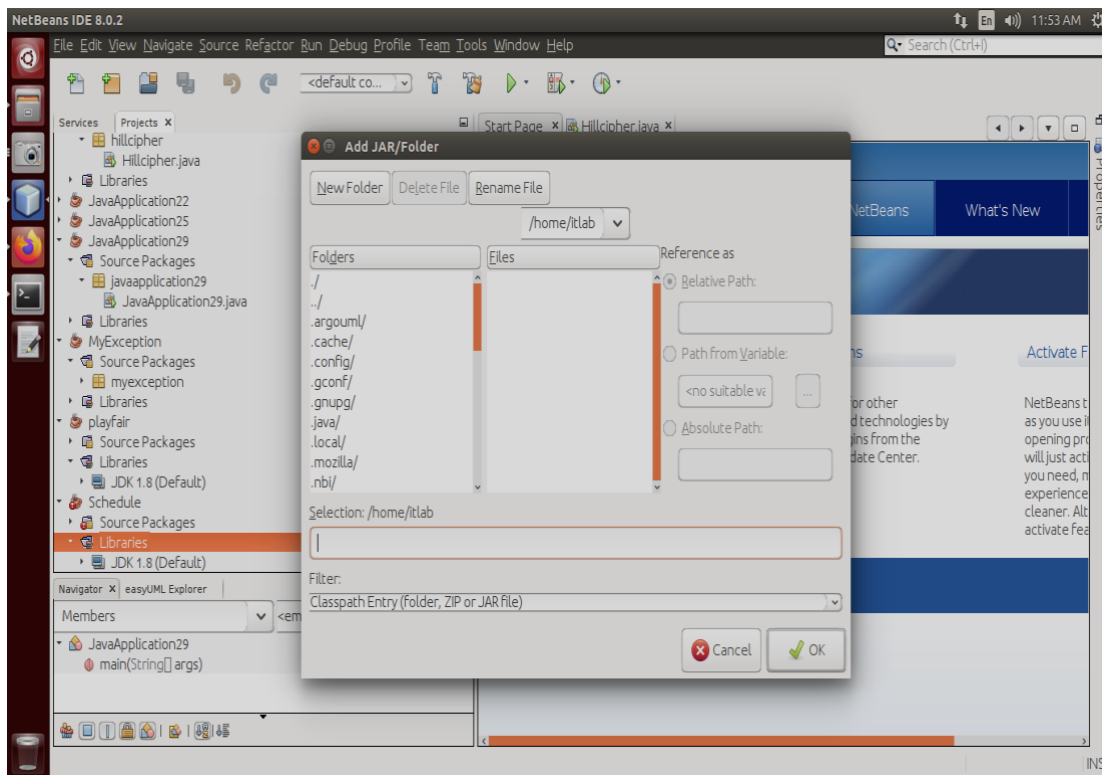

Paste the folders in the src folder of the newly created netbeans project

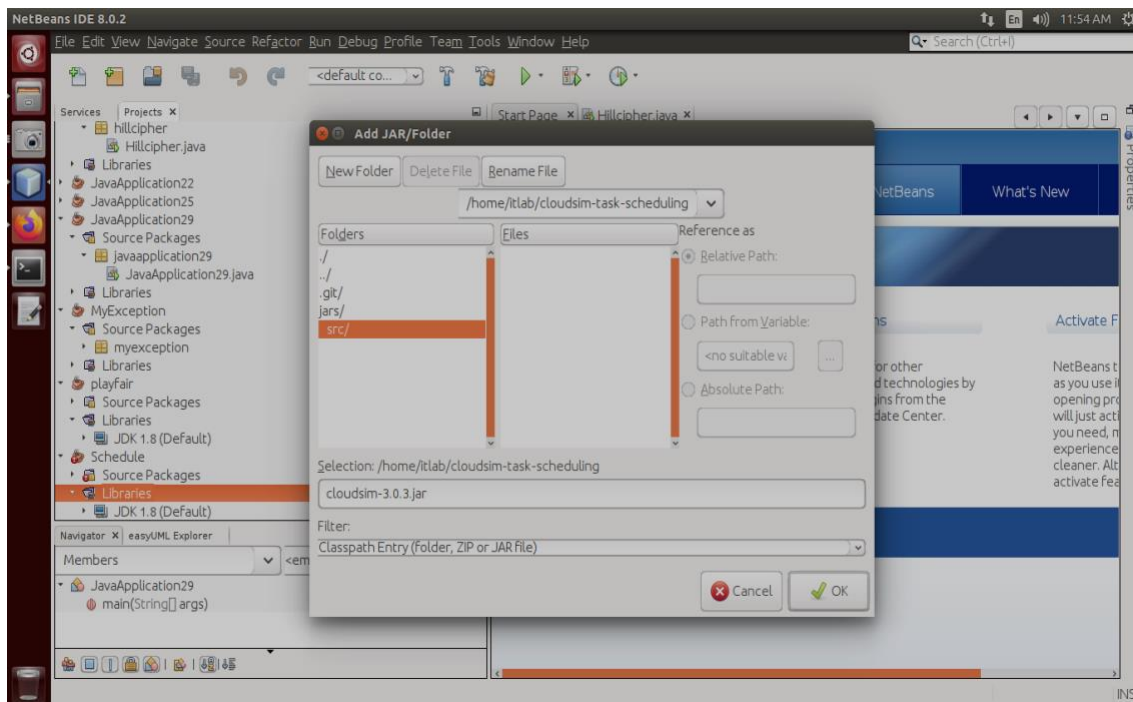

7. Also copy the cloudsim-task-scheduling.iml to the netbeans project

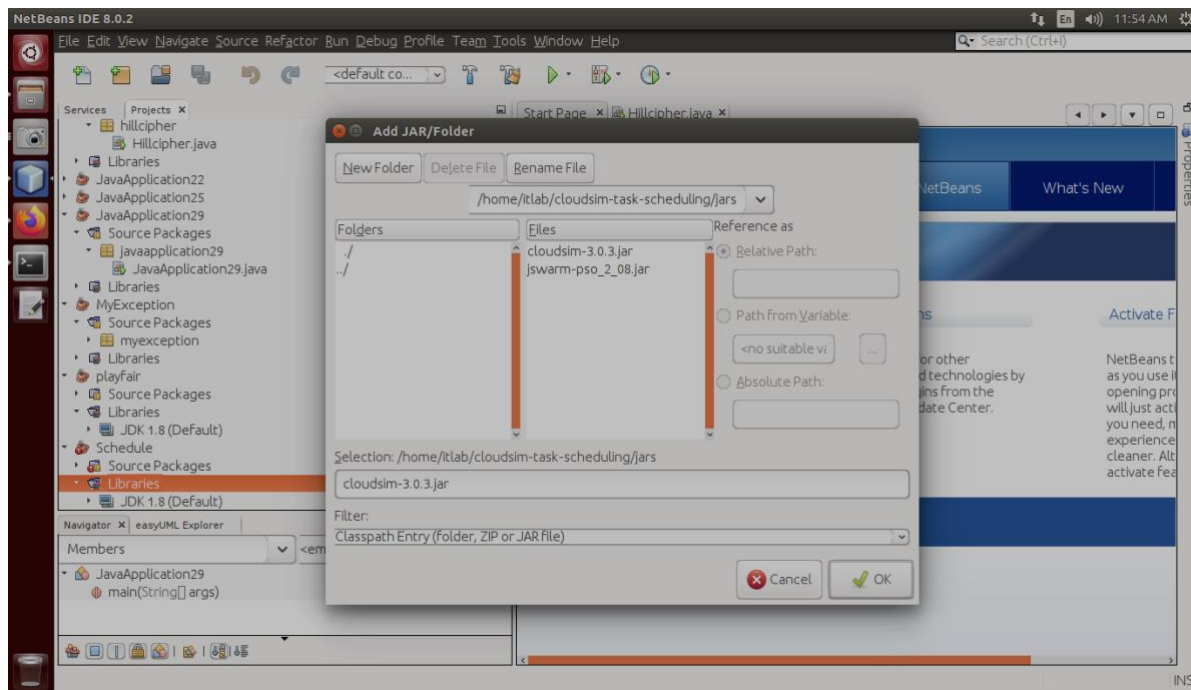

8. Go to netbeans and right click on project's libraries to add jars

Select the folder where you cloned the git project and go to jars

And double click

Select the jar file - cloudsim-3.0.3.jar and click Ok
Similarly add jswarm-pso_2_08.jar

9. To run any scheduling , expand the folder and right click on the file ending on _scheduler and run file

For FCFS, run FCFS_Scheduler.java

Program:

```
package org.cloudbus.cloudsim.examples;
import java.text.DecimalFormat;
import java.util.ArrayList;
import java.util.Calendar;
import java.util.LinkedList;
import java.util.List;

import org.cloudbus.cloudsim.Cloudlet;
import org.cloudbus.cloudsim.CloudletSchedulerTimeShared;
import org.cloudbus.cloudsim.Datacenter;
import org.cloudbus.cloudsim.DatacenterBroker;
import org.cloudbus.cloudsim.DatacenterCharacteristics;
import org.cloudbus.cloudsim.Host;
import org.cloudbus.cloudsim.Log;
import org.cloudbus.cloudsim.Pe;
import org.cloudbus.cloudsim.Storage;
import org.cloudbus.cloudsim.UtilizationModel;
import org.cloudbus.cloudsim.UtilizationModelFull;
import org.cloudbus.cloudsim.Vm;
import org.cloudbus.cloudsim.VmAllocationPolicySimple;
import org.cloudbus.cloudsim.VmSchedulerTimeShared;
import org.cloudbus.cloudsim.core.CloudSim;
import org.cloudbus.cloudsim.provisioners.BwProvisionerSimple;
import org.cloudbus.cloudsim.provisioners.PeProvisionerSimple;
import org.cloudbus.cloudsim.provisioners.RamProvisionerSimple;
```

```
/**
 * An example showing how to create
 * scalable simulations.
 */

Procedure to launch virtual machine using trystack**Aim:**

To understand the procedure to launch virtual machine using trystack.

Description:

OpenStack is an open-source software cloud computing platform. OpenStack is primarily used for deploying an infrastructure as a service (IaaS) solution like Amazon Web Service (AWS). In other words, you can *make your own AWS* by using OpenStack.

Procedure:**1. Open trystack page using trystack.org****2. Login to trystack by creating account.****3. Create Network**

- a) Go to Network > Networks and then click Create Network.

- b) In Network tab, fill Network Name for example internal and then click Next.
- c) In Subnet tab,
- d) Fill Network Address with appropriate CIDR, for example 192.168.1.0/24. Use private network CIDR block as the best practice.
- e) Select IP Version with appropriate IP version, in this case IPv4.
- f) Click Next.
- g) In Subnet Details tab, fill DNS Name Servers with 8.8.8.8 (Google DNS) and then click Create.3.

4. Create Instance

- 1. Go to Compute > Instances and then click Launch Instance.
- 2. In Details tab,
 - Fill Instance Name, for example Ubuntu 1.
 - Select Flavor, for example m1.medium.
 - Fill Instance Count with 1.
 - Select Instance Boot Source with Boot from Image.
 - Select Image Name with Ubuntu 14.04 amd64 (243.7 MB) if you want install Ubuntu 14.04 in your virtual machine.
- 3. In Access & Security tab,
 - Click [+] button of Key Pair to import key pair. This key pair is a public and private key that we will use to connect to the instance from our machine.
 - In Import Key Pair dialog,
 - Fill Key Pair Name with your machine name (for example Edward-Key).
 - Fill Public Key with your SSH public key (usually is in ~/.ssh/id_rsa.pub). See description in Import Key Pair dialog box for more information. If you are using Windows, you can use Puttygen to generate key pair.
 - Click Import key pair.
 - In Security Groups, mark/check default.
- 4. In Networking tab,
 - In Selected Networks, select network that have been created in Step 1, for example internal.
- 5. Click Launch.
- 6. If you want to create multiple instances, you can repeat step 1-5. I created one more instance with instance name Ubuntu 2.

5. Create Router

- a) Go to Network > Routers and then click Create Router.
- b) Fill Router Name for example router1 and then click Create router.
- c) Click on your router name link, for example router1, Router Details page.
- d) Click Set Gateway button in upper right:
 - Select External networks with external.
 - Then OK.
- e) Click Add Interface button.
 - Select Subnet with the network that you have been created in Step 1.
 - Click Add interface.
- f) Go to Network > Network Topology. You will see the network topology. In the example, there are two network, i.e. external and internal, those are bridged by a router. There are instances those are joined to internal network.

6. Configure Floating IP Address

Floating IP address is public IP address. It makes your instance is accessible from the internet. When

you launch your instance, the instance will have a private network IP, but no public IP. In OpenStack, the public IPs is collected in a pool and managed by admin.

- Go to Compute > Instance.
- In one of your instances, click More > Associate Floating IP.
- In IP Address, click Plus [+].
- Select Pool to external and then click Allocate IP.
- Click Associate.
- Now you will get a public IP, e.g. 8.21.28.120, for your instance.

7. Configure Access & Security

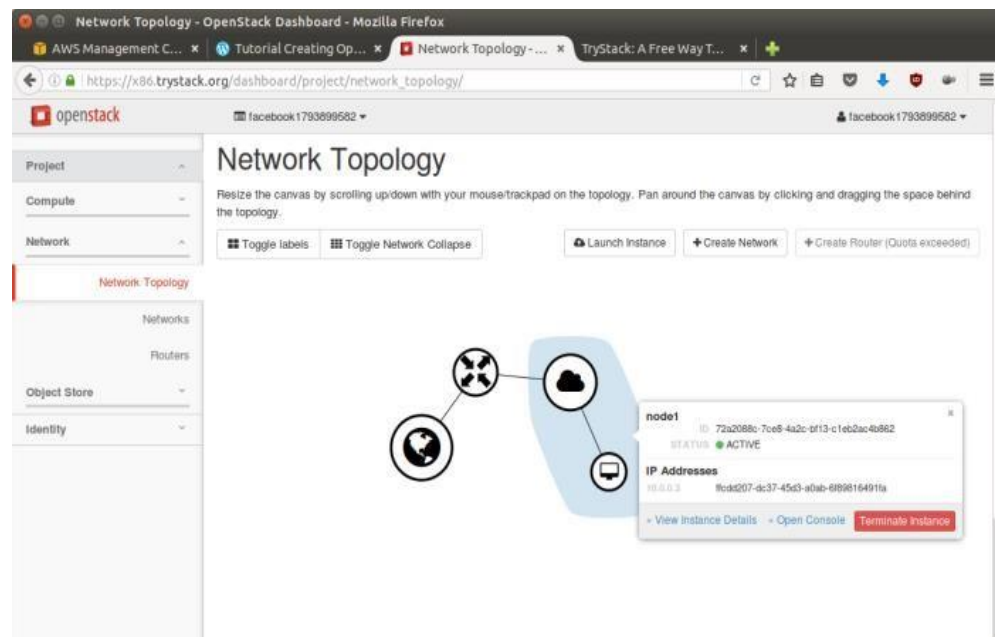

OpenStack has a feature like a firewall. It can whitelist/blacklist your in/out connection. It is called *Security Group*.

- Go to Compute > Access & Security and then open Security Groups tab.
- In default row, click Manage Rules.
- Click Add Rule, choose ALL ICMP rule to enable ping into your instance, and then click Add.
- Click Add Rule, choose HTTP rule to open HTTP port (port 80), and then click Add.
- Click Add Rule, choose SSH rule to open SSH port (port 22), and then click Add.
- You can open other ports by creating new rules.

8. SSH to Your Instance

Now, you can SSH your instances to the floating IP address that you got in the step 4. If you are using Ubuntu image, the SSH user will be ubuntu.

OUTPUT :

Result: Thus the procedure to launch virtual machine in trystack is studied
